Technical & Security

Architecture, tenant isolation, security posture, and the questions your reviewer will ask.

FOR YOUR TECHNICAL REVIEWER

IBROWSEJOBS TECHNOLOGIES PVT LTD · 2026 EDITION

Commercial in confidence. Prepared for evaluation by the named recipient and not for onward distribution.

ARCHITECTURE

How it is built.

A Laravel 11 API and a Next.js 15 front end over MySQL and Redis, deployed per environment. Tenancy is enforced in the data layer rather than the UI, so isolation does not depend on a screen being hidden.

LAYER	WHAT RUNS THERE
Front end	Next.js 15, App Router, server components; student, trainer, admin and employer portals.
API	Laravel 11 (PHP 8.3), versioned /api/v1, thin controllers over single-purpose Action classes.
Data	MySQL 8 with a tenant_id on every domain table, foreign keys and indexes.
Async	Redis-backed queues for every side effect — AI calls, messaging, PDF renders, Zoom calls.
AI	A single provider-switchable gateway; every call logged to ai_events with cost and latency.
Storage	S3-compatible object storage for documents, recordings and generated PDFs.

SECURITY POSTURE

CONTROL	IMPLEMENTATION
Authentication	Cookie-based SPA session auth with role and permission checks per route.
Magic links	Signed, single-use, short-expiry, scoped to one action and consumed atomically.
Webhooks	Razorpay, Zoom and WhatsApp signatures verified before processing; unsigned rejected.
Rate limiting	Auth, OTP and AI endpoints rate limited; per-student daily AI budget enforced.
Secrets	Environment-held, never in code, seeds, tests or documentation.
Money	All currency handled in integer paise — never floating point.

The question your reviewer will actually ask.

Isolation is enforced in the data layer, not the interface. A screen being hidden is not a security control.

MECHANISM

HOW IT WORKS

Global scope, not a WHERE clause

Every domain model uses the BelongsToTenant trait, so tenant scoping is applied by the ORM rather than remembered by each query.

Tested, not asserted

The engineering standard requires a cross-tenant denial test for every feature; isolation tests span the API test suite.

Two resolution paths

Public pages resolve the tenant by domain; portals resolve it by the authenticated user. A request cannot silently fall through to another tenant.

Audit trail

Grade changes, fee waivers, access blocks, roster and role changes are written to an audit log rather than mutating silently.

EVIDENCE, ON REQUEST

We will walk your reviewer through the tenant scoping trait, the two resolution middlewares and the cross-tenant denial tests in the API suite, on a screen share, before you sign.

TO BE AGREED PER ENGAGEMENT

These are deliberately not pre-answered. They depend on your compliance requirements and are settled in the order form and DPA rather than asserted in a brochure.

- ✓ Hosting region and data residency
- ✓ Shared or dedicated database instance
- ✓ Backup frequency, retention, and tested restore window (RPO / RTO)
- ✓ Penetration-test cadence and who commissions it
- ✓ Sub-processor list and change notification period
