

Zoom — from zero to live classes

Anyone can follow this. No coding needed. Total time: about 45 minutes.

*You will do six parts, in order. The only ordering that matters: **Part D must happen before the last step of Part C** — Zoom's green Validate checkmark only works after the codes are saved in the LMS.*

PART A Buy the right Zoom plan · 10 MIN

1. Go to zoom.us and sign in (or create an account) with a company email, e.g. hello@browsejobs.ai. This account becomes the owner of everything — use a company login, not a personal one.
2. Click **Plans & Pricing** and choose **Zoom Workplace Pro**.
3. Choose the **number of licenses**. Rule of thumb: 1 license = 1 class running at a time. If two trainers will ever teach at the same time, buy 2. You can add more later in two clicks, so start small.
4. Pay. Pro is roughly Rs. 1,300 per license per month billed yearly — check the page for current pricing.

***Why Pro and not Free?** Free accounts have a 40-minute limit and no cloud recording. Recording is what puts class replays inside the LMS, so Pro is the minimum.*

A2 — Add your trainers as licensed users

1. Still on zoom.us, open **Admin** → **User Management** → **Users** → **Add Users**.
2. Enter each trainer's email, set **User Type** = **Licensed**, send the invite.
3. Each trainer accepts the email invite. Done when every trainer shows as **Licensed** in the list.

A3 — Switch on cloud recording

1. Open **Admin** → **Account Management** → **Account Settings** → **Recording** tab.
2. Turn ON **Cloud recording**. Leave the defaults.

PART B Create the Zoom app · 10 MIN

This gives you 3 secret codes the LMS needs. Treat them like passwords.

1. Go to marketplace.zoom.us and sign in with the same account.
2. Top-right: **Develop** → **Build App**.
3. Pick **Server-to-Server OAuth** → **Create**. Name it **BrowseJobs LMS**.
4. The first screen shows your three codes. Copy each into a private note: **Account ID**, **Client ID**, **Client Secret**.
5. Fill the required "Information" fields (app name, company name, your email).

- Open the **Scopes** step → **Add Scopes**, then search and tick:
 - meeting** — tick the **admin** scopes for **read**, **write/create**, **update** and **delete** meetings
 - cloud_recording** — tick the **admin read** scope
 - user** — tick the **admin read** scope
- Click through to **Activate** the app. It must say **Activated**.

PART C Connect Zoom's events to the LMS · 10 MIN

This is how the LMS learns who attended and when a recording is ready.

- In the same app, open the **Feature** (Event Subscriptions) section.
- Copy the **Secret Token** shown there — this is your 4th code.
- STOP. Go do Part D now** (paste all 4 codes into the LMS). Then come back here.
- Click **Add Event Subscription**. Name: **LMS events**. Event notification endpoint URL: <https://api.browsejobs.ai/api/webhooks/zoom>
- Click **Add Events** and tick exactly these three:
 - Meeting → **Participant/Host joined meeting**
 - Meeting → **Participant/Host left meeting**
 - Recording → **All Recordings have completed**
- Click **Validate** next to the URL. It should turn green (this only works after Part D is done).
- Click **Save**.

PART D Enter the 4 codes in the LMS · 5 MIN

- Log in to the LMS admin panel as the **super admin**.
- Open **Settings** (left sidebar, visible to super admin only) → find the **Zoom** section.
- Paste the four codes into the four boxes:

LMS field	Where you got it
Account ID	Part B, step 4
Client ID	Part B, step 4
Client secret	Part B, step 4
Webhook secret token	Part C, step 2

- Click **Save**. That's it — no restart, no redeploy. (Secrets show as **••••** afterwards; that's normal.)
- Now go back and finish Part C, steps 4–7.

PART E Tell the LMS about your licenses · 5 MIN

- In the LMS admin panel, open **Zoom licenses** (left sidebar).

2. For each Zoom license you bought, click **Add**:
 - **Zoom user** — the trainer's email exactly as it appears in Zoom's user list
 - **Label** — anything human, e.g. "Ravi – seat 1"
3. **Allocate** each license to its mentor/trainer using the picker.

This is what lets two classes run at the same time — each trainer hosts under their own seat. A trainer without a license still works: their classes host under the main account (but then only one at a time).

PART F Test it end to end · 10 MIN

1. Admin → **Batches** → pick a batch → schedule a test class 15 minutes from now. Leave **Record this class** ticked.
2. Within a minute the class should show a **Join** link (the LMS creates the Zoom meeting in the background).
3. Join as the trainer (start URL) and as a test student (join button in the student portal) from another browser.
4. Stay 2–3 minutes, then end the meeting for everyone.
5. Check the results:
 - **Attendance** — the student's join/leave time appears on the session in admin.
 - **Recording** — 5–20 minutes after the class ends (Zoom needs time to process), the replay appears in the student's **My Classes**.

If all of that works, you're live.

If something doesn't work

Symptom	Fix
Part C "Validate" stays red	The 4 codes aren't saved in LMS Settings yet, or the Webhook secret token doesn't match. Redo Part D, then Validate again.
Class scheduled but no Join link	Account ID / Client ID / Client secret wrong, app not Activated, or a missing meeting scope — check Part B. Also confirm the server's background worker is running (it is started by the deploy script).
"User does not exist" errors on scheduling	The email in Zoom licenses doesn't exactly match a Licensed user in Zoom. Fix the email or license the user (Part A2).
Attendance empty after class	The two Meeting participant events aren't ticked in Part C, or students joined with an email different from their LMS login email.
No recording appears	Cloud recording off (Part A3), "Record this class" was unticked, or the Recording event isn't ticked in Part C. Wait 20 minutes before judging — Zoom processing takes time.
